

ONE Native DevOps Platform for SAP On-Premise, CPI and Cloud Applications

ReleaseOwl is the first Enterprise-grade Native DevOps Platform designed for SAP Applications. Be it supporting your current investment on SAP on-premise or enabling you to migrate to SAP Cloud with confidence or accelerate your application development on SAP cloud - ReleaseOwl serves as one platform for automated packaging, deployment, testing, and compliance of SAP Applications.

5X Faster Go-to-Market

Continuous delivery of Software is essential to meet the speed of the business today. With its CI/CD pipelines that automate package and deployment of SAP applications, its Compliance Checks with integrations like SonarQube, ATC, CPILint, etc., and orchestrated workflows driving seamless collaboration and approval process, ReleaseOwl ensures that customers experience faster go-to-market with increased reliability.

5x
FASTER

70% Reduced Downtime

Downtime is critical to business both in terms of customer experience as well as employee confidence and productivity. With an early warning system powered by ReleaseOwl, you can shift left the defect detection in the Software Life Cycle to ensure thorough efforts are put early in the development. Along with this, a proper backup and rollback mechanism built into your SAP deployment process will ensure that any occurrence of downtime can be reduced significantly.

3X Improved Productivity

Code Reviews and Compliance testing integrated into the development process produces better quality code and reduces defects in higher environments. Add to this, the increased deployment frequency, reduced time for deployment and failure analysis, ensuring more productive time for development

3x
Improved
Productivity

0 Setup and Maintenance Cost

ReleaseOwl comes with out-of-box DevOps workflows for both SAP on-prem and cloud applications delivered as a SAAS offering. It would mean no need for extensive SAP installation or expert teams to manage the software. The upgrades and maintenance of the application are all done by ReleaseOwl as part of the SAAS offering.

Features

Continuous Delivery for SAP Applications

- » ReleaseOwl has custom DevOps Pipelines for each flavor of SAP all supported out-of-the-box as SAAS offering.
- » For SAP On-premise application, ReleaseOwl supports seamless Transport Management with automated deployments, dependency checks, and Transport sequencing.

- » For SAP Business Technology Platform, there is support for MTAR based deployments, GIT Integration for ABAP Cloud with gCTS.
- » For SAP Cloud Platform Integration, there is support for automated packaging and deployment of CPI content (Iflows and ValueMaps) as well as back and up roll-back of CPI deployments.

Orchestrated DevOps Workflows

Release Management is often a highly collaborated effort involving approvals of multiple stakeholders at various stages of Release viz., Dev Teams, QA Teams, Release Managers, and DevOps teams. With a powerful workflow engine built into ReleaseOwl teams can set up approval processes, track environment-level configuration changes, and automate the deployment process across the landscape ensuring seamless release management

Backup and Rollback

ReleaseOwl is the first DevOps platform offering support for backup and rollback of CPI content. If your team is developing SAP CPI content with IFlows and ValueMaps, ReleaseOwl will provide the Code versioning, automated packaging and deployments, backup and rollback support for your CPI content.

DevOps Capability for SAP CPI

Testing, Compliance and Audit Trail

- » ReleaseOwl has rich capabilities for Unit Testing and Code Coverage checks for Transports, ABAP Unit etc.,
- » For code review and compliance purposes, there is out-of-the-box integration with SonarQube (UI and Cloud Apps), ATC (for ABAP), CPILint (SAP CPI)
- » Audit trail for every change that is deployed in the landscape, every approval that is given with complete change tracking for your sub-accounts and target systems

Third Party Integrations

ReleaseOwl has rich integrations with various ALM systems like Jira, ServiceNow, etc., which enable user story/ incident tagging for your code/configuration changes. The sync is bi-directional so that as change gets deployed into an environment in the pipeline, the story status gets updated in your ALM system instantly. This will ensure more comprehensive change management for your applications.

Third Party Integrations
